[0010] Typical production processes of the substituted anilide derivative represented by general formula (I) of the present invention are described below but they are not intended in any way to limit the scope of the present invention.

Production process 1.

[0011]

wherein R¹, R², R³, X, m, n, t and Q are as defined above, R⁴ is a hydrogen atom, a (C₁-C₆)alkyl group, a halo(C₁-C₆)alkyl group, a phenyl group, a substituted phenyl group or a phenyl(C₁-C₄)alkyl group, and W is -O-, -S- or -N(R⁴)- wherein R⁴ is as defined above.

[0012] A substituted anilide derivative (I-3), i.e., a substituted anilide derivative of general formula (I) in which Z is O, can be produced by allowing an aniline derivative of any of general formula (II-1) to general formula (II-3) to react with a heterocyclic carboxylic acid chloride of general formula (III) in an inert solvent in the presence or absence of a base, or by allowing an aniline derivative of any of general formula (II-1) to general formula (II-3) to react with a heterocyclic carboxylic acid of general formula (IV) in an inert solvent in the presence of a condensing agent and in the presence or absence of a base. The production may be carried out by any conventional production process of an amide.

[0013] The aniline derivative of general formula (II-2) can be produced by reducing the aniline derivative of general formula (II-1) in an inert solvent in the presence of a reducing agent.

[0014] The aniline derivative of general formula (II-3) can be produced by allowing the aniline derivative of general formula (II-1) to react with an alcohol derivative, thiol derivative or amine derivative of general formula (V) in an inert solvent in the presence or absence of a base.

General formula (II-1) → general formula (II-2)

[0015] The reducing agent usable in this reaction includes, for example, metal hydrides such as aluminum lithium hydride, lithium boron hydride, sodium boron hydride, diisobutylaluminum hydride, sodium bis(2-methoxyethoxy)aluminum hydride, etc.; and metals or metal salts, such as metallic lithium, etc. As to the amount of the reducing agent used, the reducing agent may be used in an amount properly chosen in the range of 1 equivalent to excess equivalents per equivalent of the aniline derivative of general formula (II-1).

[0016] As the inert solvent used in the reaction, any inert solvent may be used so long as it does not markedly inhibit the progress of the reaction. There can be exemplified inert solvent including, for example, aromatic hydrocarbons such as benzene, toluene, xylene, etc.; halogenated hydrocarbons such as methylene chloride, chloroform, carbon tetrachloride, etc.; halogenated aromatic hydrocarbons such as chlorobenzene, dichlorobenzene, etc.; and acyclic or cyclic ethers such as diethyl ether, dioxane, tetrahydrofuran, etc. These inert solvents may be used singly or as a mixture thereof.

[0017] As to the reaction temperature, the reaction can be carried out at room temperature to the boiling point of the inert solvent used. Although the reaction time is varied depending on the scale of reaction, the reaction temperature, etc., the reaction may be carried out for a period ranging from several minutes to 50 hours.

[0018] After completion of the reaction, the desired compound is isolated from the reaction system containing the

desired compound by a conventional method, and if necessary, purified by recrystallization, column chromatography, etc., whereby the desired compound can be produced. The desired compound can be subjected to the subsequent reaction step without isolation from the reaction system.

5 General formula (II-1) → general formula (II-3)

[0019] The base usable in this reaction includes metal hydrides such as lithium hydride, sodium hydride, potassium hydride, etc.; metal alcoholates such as sodium methoxide, sodium ethoxide, potassium t-butoxide, etc.; and alkyl metals such as n-butyllithium, s-butyllithium, t-butyllithium, etc. As to the amount of the base used, the base may be used in an amount properly chosen in the range of 1 equivalent to excess equivalents per equivalent of the aniline derivative of general formula (II-1).

[0020] As the inert solvent used in the reaction, any inert solvent may be used so long as it does not markedly inhibit the progress of the reaction. There can be exemplified inert solvent including, for example, aromatic hydrocarbons such as benzene, toluene, xylene, etc.; alcohols such as methanol, ethanol, etc.; and acyclic or cyclic ethers such as diethyl ether, 1,2-dimethoxyethane, dioxane, tetrahydrofuran, etc. These inert solvents may be used singly or as a mixture thereof.

[0021] As to the reaction temperature, the reaction can be carried out at -70°C to the boiling point of the inert solvent used. Although the reaction time is varied depending on the scale of reaction, the reaction temperature, etc., the reaction may be carried out for a period ranging from several minutes to 50 hours.

[0022] After completion of the reaction, the desired compound is isolated from the reaction system containing the desired compound by a conventional method, and if necessary, purified by recrystallization, column chromatography, etc., whereby the desired compound can be produced. The desired compound can be subjected to the subsequent reaction step without isolation from the reaction system.

25 General formula (II-1), general formula (II-2) or general formula (II-3) → general formula (I-3)

[0023] The condensing agent used in this reaction includes, for example, diethyl cyanophosphonate (DEPC), carbonyl-dimidazole (CDI), 1,3-dicyclohexylcarbodiimide (DCC), chlorocarbonic acid esters and 2-chloro-1-methylpyridinium iodide.

[0024] As the base used in the reaction, inorganic bases or organic bases are exemplified. The inorganic bases include, for example, hydroxides of alkali metal atoms, such as sodium hydroxide, potassium hydroxide, etc.; hydrides of alkali metals, such as sodium hydride, potassium hydride, etc.; alkali metal salts of alcohols, such as sodium ethoxide, potassium t-butoxide, etc.; and carbonates such as sodium carbonate, potassium carbonate, sodium hydrogencarbonate, etc. The organic bases include, for example, triethylamine, pyridine and DBU. As to the amount of the base used, the base may be used in an amount properly chosen in the range of 1 mole to excess moles per mole of the heterocyclic carboxylic acid derivative of general formula (IV).

[0025] As the inert solvent used in the reaction, any inert solvent may be used so long as it does not markedly inhibit the progress of the reaction. There can be exemplified inert solvent including aromatic hydrocarbons such as benzene, toluene, xylene, etc.; halogenated hydrocarbons such as methylene chloride, chloroform, carbon tetrachloride, etc.; halogenated aromatic hydrocarbons such as chlorobenzene, dichlorobenzene, etc.; acyclic or cyclic ethers such as diethyl ether, dioxane, tetrahydrofuran, etc.; esters such as ethyl acetate, etc.; amides such as dimethylformamide, dimethylacetamide, etc.; dimethyl sulfoxide; 1,3-dimethyl-2-imidazolidinone; acetone; methyl ethyl ketone; and the like. These inert solvents may be used singly or as a mixture thereof.

[0026] Since the reaction is an equimolar reaction, it is sufficient that the reactants are used in equimolar amounts, though either of them may be used in excess. As to the reaction temperature, the reaction can be carried out at room temperature to the boiling point of the inert solvent used. Although the reaction time is varied depending on the scale of reaction, the reaction temperature, etc., the reaction may be carried out for a period ranging from several minutes to 48 hours.

[0027] After completion of the reaction, the desired compound is isolated from the reaction system containing the desired compound by a conventional method, and if necessary, purified by recrystallization, column chromatography, etc., whereby the desired compound can be produced.

[0028] The aniline derivative of general formula (II-1), i.e., the starting material in the reaction can be produced according to the production process disclosed in JP-A-11-302233 or JP-A-2001-122836.

[0030] A substituted anilide derivative (I-4), i.e., a substituted anilide derivative of general formula (I) in which Z is S, can be produced by allowing a substituted anilide derivative of general formula (I-3) to react with Lawson reagent according to a well-known method (Tetrahedron Lett., 21(42), 4061 (1980)).
